

Develop a custom module events.

When installed, the module must create an event content type, an event_type taxonomy.

Events must contain the following fields:

✓title

✓description

✓image (Media)

✓date

✓type-selection of taxonomy terms (event_type)

✓participants - Drupal users, specify more than one if it is possible.

Conditions:

1. Authorized user can view events in the public part.

2. Only events associated with participants can see the user.

3. Events should be edited as a table or list on separate pages. You can use Views or Module Controller.

It is necessary to develop a service for sending messages, which is called through the console of the drush notify-participants command.

Notifications must be sent to the mail of each of the participants.

The letter must contain information about the event (Title, Description, Date, Image, Event Type).

Notes:

* Content type, taxonomy and fields must be created during module installation. This also applies to the public part; in case you use Views to display an Event.

* If you are using third-party Drupal modules, they must also be installed during the installation of your own.

* The module must be published on GitHub.
